How to Use the Healthcare Providers’ Action Guide

The Exercise is Medicine® Healthcare Providers’ Action Guide provides physicians and other healthcare professionals with a simple, fast, and effective tool for integrating physical activity in their daily practice. By promoting the right “dosage” of physical activity, you are prescribe a highly effective “drug” to your patients for the prevention, treatment, and management of more than 40 of the most common chronic health conditions encountered in primary practice.

This Guide acknowledges and respects that today’s modern healthcare provider may have only a brief window of time for physical activity counseling (at times no more than 20-30 seconds) during a normal office visit. Given this short time period, this Guide seeks to empower you to:

1. Assess the physical activity level of your patients;
2. Write a prescription for physical activity, depending on the health, fitness level, and preferences of your patients, and
3. Refer your patients to certified exercise professionals, who specialize in physical activity counseling and will oversee your patients’ exercise program.

Here’s how you can get started:

1. Review this Action Guide. The Physical Activity Assessment, Prescription and Referral Process documents are the core of the guide and will explain how you can quickly assess physical activity levels, provide exercise prescriptions, and refer patients to certified exercise professionals.
2. Print out and display copies of the Office Flyers in your waiting room and throughout your clinic.
3. Regularly assess and record the physical activity levels of your patients at every clinic visit using the Physical Activity Vital Sign.
4. Provide your patients with a basic prescription using the EIM Prescription Pad to get them started on their physical activity program.
5. For patients with chronic health conditions, the Your Prescription for Health series will provide them with more specialized guidance on how to safely exercise with their condition.
6. Once you are comfortable with the prescription process, begin referring your patients to local exercise professionals who will help supervise them as they “fill” their physical activity prescriptions!

These steps are all described in greater detail throughout the rest of this Action Guide. Keep reading to find how you can make a difference in getting your patients to be more physically active!
Promoting Physical Activity in Your Clinic Setting

Physical activity is a key component in achieving a healthy lifestyle and disease prevention. In contrast, physical inactivity accounts for a significant proportion of premature deaths worldwide. As a healthcare professional, you are in a unique position to provide such expertise to your patients and employees in helping them develop healthy lifestyles by actively counseling them on being physically active.

1. The first step you can take within your healthcare setting is to ensure that you “walk the talk” yourself. Data suggests that the physical activity habits of physicians influence their counselling practices in the clinic. To be a role model for your healthcare team and to gain the trust of your patients, an important first step is setting an example and showing that being physically active is important to you!

2. Next, we encourage you to focus on the well-being of your healthcare team and implement steps that will increase their physical activity levels and healthy lifestyle choices. Some of these steps may include:
   - Implementing wellness challenges and programs
   - Offering physical activity classes (i.e., yoga) and educational sessions
   - Transform your stairwells into a welcoming environment and use promotional materials to encourage employees and visitors to use the stairs
   - Implement activity breaks for meetings that are longer than one hour, and
   - Provide discounts for memberships at the local gym.

3. Finally, we strongly encourage you to promote physical activity in your clinic setting. You may not always have time to engage your patient in conversations about their physical activity levels, but there are simple steps that you can take to make sure they realize its importance in their personal health. By calling attention to and promoting small, simple things that they can do, it will add up to a much more active, healthier patient. The content of effective physical activity messages need to be simple and clear.

To help you get started, Exercise is Medicine® has developed a series of Office Flyers that can be downloaded from our website and printed for use in your clinic (see Appendix A). We encourage you to post the flyers in your patient waiting and examination rooms. Copies of the flyers can be left on display on tables for patients to take with them after they have left your office. Together, they will create an immediate, first impression on your patients before they even begin their visit!

Please feel free to share these materials with all of your colleagues!

Assessing the Physical Activity Levels of Your Patients

One of most important decisions your patients will make regarding their overall health is to incorporate physical activity into their lifestyle. Your discussion of their current physical activity levels may be the greatest influence on their decision. The assessment of their physical activity levels initiates this discussion, highlights the importance of physical activity for disease prevention and management, and enables your healthcare team to monitor changes over subsequent medical visits.

While there are multiple advanced and comprehensive physical activity assessments tools available, time constraints often necessitate a simple and rapid tool. Assessing the current physical activity levels of your patients can be quickly achieved through the use of the Physical Activity Vital Sign (PAVS) - a tool designed to allow you, or members of your healthcare team, to assess and record the physical activity levels of your patients in less than a minute. Asking your patients about their PA levels requires a minimal time investment with a potentially high yield to their health.

The PAVS consists of two questions: “On average, how many days per week do you engage in moderate to strenuous exercise like a brisk walk?” and “On average, how many minutes do you engage in exercise at this level?” See Appendix B for a printable version of the PAVS that can be used in your office. These two screening questions will provide you with a snapshot of whether your patients are meeting the current PA guidelines of 150 minutes of moderate intensity physical activity each week. By repeating the assessment of PAVS at every clinic visit, you will be able to track changes in their physical activity levels over time. The PAVS is highly associated with decreased levels of BMI and odds of obesity and has been tested for face and discriminant validity.

The PAVS tool is optimally used in the clinic setting when it is integrated as a required response in your EMR system. The PAVS was first implemented in the EMR in clinical practice in 2010 in the Kaiser Permanente healthcare system in California. Since that time, more than 2 million PAVS have been collected by physicians and their healthcare teams. More recently, use of the PAVS in clinical practice was linked to favorable changes in metabolic outcomes in a population of over one million adults in the Kaiser Permanente healthcare system in Northern California.

Prescribing Physical Activity to Your Patients

If there was one prescription that could prevent and treat dozens of diseases, such as diabetes, hypertension, and obesity shouldn’t we be prescribing it to all of our patients? Certainly! Providing your patient with a physical activity prescription is the next key step you can take in helping your patients become more active. Given the growing evidence that increasing PA provides greater benefits to multiple health factors than any single pill, we urge healthcare providers to consider using physical activity prescription as a first-line therapy. Your encouragement and guidance may be the greatest influence on this decision as patient behavior can be positively influenced by physician intervention.

The steps provided below will give you guidance in assessing your patients and their needs in becoming more active. At this point, you’ve already determined their current physical activity level (the Physical Activity Vital Sign). Next, you will determine if your patient is healthy enough for independent physical activity. Finally, you will be provided with an introduction to the Exercise Stages of Change model to help determine which strategies will best help your patient become physically active.

Step 1 - Safety Screening
Before engaging a patient in a conversation about a physical activity regimen, it is necessary to determine if they are healthy enough to exercise independently. The first step in this screening process is the administration of the Physical Activity Readiness Questionnaire (PAR-Q). The PAR-Q is a brief, 7-question screening tool that is focused on symptoms of heart disease while identifying musculoskeletal problems that should be evaluated prior to participation in an exercise program. An example of the PAR-Q can be found in Appendix C.

- If your patient answers NO to all 7 of the PAR-Q questions, they may be cleared for independent low to moderate physical activity (i.e., household chores, brisk walking).
- If your patient wished to engage in more vigorous physical activity (i.e., playing basketball, running), we encourage you to utilize more advanced safety screening tools such as the American College of Sports Medicine Risk Stratification (see Appendices D & E) or a treadmill stress test.
- If your patient answered YES to any of the PAR-Q questions, he or she may still be cleared for independent using your professional judgment. However, it may be necessary to utilize more advanced screening tools such as the American College of Sports Medicine Risk Stratification (see Appendices D & E) or a treadmill stress test to determine whether your patient should be cleared to exercise independently or whether they need to exercise under the supervision of a clinical exercise professional.
Step 2 - Determining Your Patient’s Readiness to Change

Individual behavior is a dynamic phenomenon. Individuals attempting to change their behaviors often go through a series of stages. Some patients may only be ready for encouragement, some will be prepared to take steps towards being more physically active, while others will be ready to receive a physical activity prescription and referral to certified exercise professionals. Therefore, prior to prescribing physical activity to your patients, it is important to determine their “Stage of Change”.

Most commonly, there are 5 stages of change: precontemplation, contemplation, preparation, action, and maintenance phases. By determining the stage of change that they are in, you can then take the most appropriate action based and individualize your physical activity promotion strategy. The Exercise Stages of Change questionnaire (found in Appendix F) consists of 5 questions and can be completed in a matter of minutes when your patient first checks in at your office.

The following table provides a brief outline of each of the five stages of change and recommended steps for patients in each stage.

<table>
<thead>
<tr>
<th>Stage of Change</th>
<th>Action Step</th>
</tr>
</thead>
</table>
| Precontemplation (Patient has no intention to be physically active) | • Promote being more physically active by discussing its health benefits, emphasizing the pros of changing their behavior, and helping work through the cons of being more physically active.  
• The individual is likely not ready to receive a physical activity prescription at this point. |
| | Independent | Supervision Necessary |
| Contemplation (Patient is thinking about becoming physically active) | Write prescription; refer to exercise professional.  
• Continue to emphasize the pros and reducing the cons of being more physically active.  
• The individual may be becoming receptive to receiving basic guidance on becoming more physically active. |
| Preparation (Patient is active and making small changes, but not meeting PA guidelines*) | Write prescription; refer to non-clinical exercise professionals.  
• Refer to clinical exercise professionals. |
| Action (Patient is meeting the physical activity guidelines but for less than 6 months) | Encourage continued exercise.  
• Encourage continued supervised exercise training.  
• Strengthen their commitment to change and ability to fight urges to slip back into unhealthy behaviors. |
| Maintenance (Patient is meeting the physical activity guidelines for the last 6 months or more) | Encourage continued exercise.  
• Encourage them to spend time with people with similar healthy behaviors; continue to engage in healthy activities to cope with stress instead of relying on unhealthy behavior. |

*The 2008 Physical Activity Guidelines recommends 150 minutes per week of moderate intensity physical activity or 75 minutes of vigorous intensity physical activity or some combination of the two.
Step Three - Providing Your Patient With An Exercise Prescription

For patients who have been cleared for independent exercise and are in the Preparation, Action, and Maintenance phases (and maybe even some in Contemplation), the next step is to provide them with a physical activity prescription. The simplest prescription that you can provide your patient with is to participate in 150 minutes of moderate intensity physical activity each week as suggested in the 2008 Physical Activity Guidelines for Americans\(^5\). Using the basic EIM Physical Activity Prescription Pad (see Appendix G), provide your patients with a basic, written physical activity prescription. Studies have shown that simply providing a written prescription is an effective means of motivating patients to be more physically active, sometimes by as much as one hour per week\(^6\).

Step Four - Providing Your Patient With A More Advanced Exercise Prescription

If you wish to provide your patients with a more comprehensive prescription, we encourage you to use the “Exercise Prescription Health Series” developed by Exercise is Medicine\(^5\) and leading experts from ACSM. The Exercise Prescription Health Series consists of 45 customized exercise prescriptions specifically developed for individuals with a variety of health conditions such as diabetes, cardiovascular disease, osteoarthritis, and lower back pain. Examples from the Exercise Prescription Health Series can be found in Appendix H. These exercise prescriptions can be downloaded from the EIM website (http://exerciseismedicine.org/YourPrescription.htm) for use with your patients. Your patients can then implement these prescriptions individually or take them to a certified exercise professional who can guide them in filling their customized exercise prescription.

The 2008 Physical Activity Guidelines recommend a minimum of 150 minutes of moderate, or 75 minutes of vigorous, physical activity a week (for example, 30 minutes per day, five days a week) \textit{and} muscle-strengthening activities on two or more days a week. Moderate physical activity means working hard enough to raise your heart rate and break a sweat, yet still being able to carry on a conversation. Examples include: brisk walking, ballroom dancing or general gardening.
Providing Your Patients with a Physical Activity Referral

The next important decision that your patients will make regarding their overall health is HOW to incorporate physical activity into their lifestyle. Your guidance in linking them to community resources and, more specifically to exercise professionals, is a key strategy. In fact, several studies have suggested that efforts made by healthcare systems to increase the physical activity habits of their patients are best accomplished by transforming their “patients” into “participants”. This is best done by providing your patients with information on local resources and support systems. When prescribing physical activity, it is necessary not just to counsel your patients, but to provide them with information on how and where they can ‘fill’ their prescription.

The referral to an exercise professional can be an extremely useful tool for you as a healthcare provider. A qualified exercise professional can help your patient safely start and maintain an effective exercise program. They will understand the “fitness goals” you and your patient have discussed and work with them to create a plan of action to achieve them. They can help your patients adapt these goals to their individual situations, such as fitting physical activity into their busy schedule and addressing other barriers to exercise that they may face. An exercise professional can also be a great source of motivation and encouragement, as well as a resource for the latest objective health and fitness information. A referral to a qualified exercise professional can give your patient all the information and support they need to start and maintain an exercise program and save you time in the office.

Consulting the American College of Sports Medicine

The first step that you can take is to consult with the American College of Sports Medicine (www.acsm.org) about the appropriate qualifications for exercise professionals. While online you can use the ACSM’s Pro Finder, an online database that displays ACSM certified exercise professionals. Once you have found one or a few individuals you believe may be a good match, it is important to ask questions about their background, certifications and client practices. For more details on what to look for in an exercise professional, please keep reading through the end of the document.

Finding Qualified Exercise Professionals

As with any specialist, it is important to find one or more fitness professionals to whom you are comfortable referring your patients. A health fitness professional will understand the fitness goals you and your patient have discussed, help them refine those goals, and design a carefully structured plan to help your patient achieve them. A referral to qualified health fitness professional can give your patient all the information and support they need to start and maintain an exercise program and save you time in the office. Below we offer several suggestions on how you can develop a trusted exercise referral network as part of your clinic practice.
Questions to ask an Exercise Professional
As with a referral to any specialist, you should use your professional judgment and due
diligence in choosing appropriately trained individuals to partner with in providing the
best care possible for your patients. Questions that you could ask exercise
professionals in helping you make this decision include:

- Do they hold a 4-year degree from an accredited university in Exercise Science,
  Kinesiology, Exercise Physiology, or a related health and fitness field?
- How long have they been a personal trainer? Do they have additional training and
certification by a nationally-recognized organization a?
- Is he or she certified in first aid and CPR?
- Do they have liability insurance?
- What types of clients and special populations do they have experience working with?
- Will they read the background information you send on your patients?
- Will they ask your patients specific questions before beginning an exercise program,
  about their medical conditions, medications currently being taken, previous injuries
  and surgeries, and aches and pains as they relate to being physical active?
- Do they conduct fitness assessments as part of their physical activity counseling?
- Are they willing to provide you feedback on your patient’s progress?

These questions should help you begin to gauge if an exercise professional would be a
good addition to your referral network.

EIM Credentialed Exercise Professionals
To ensure that the health fitness professionals in your network are trustworthy, EIM has
developed a credential program that will provide health fitness professionals with an
additional skill set that will allow them to work closely with the medical community (such
as your clinic) and receive patient referrals. Through their training for the EIM
Credential, exercise professionals are:

- Certified as EIM Exercise Professionals who are eligible to work as a trusted
  referral source with your patients.
- Trained to work with a wide variety of individuals from those who are apparently
  healthy to those with more serious health-related conditions.
- Trained in behavior change theories to empower their clients to make sustainable
  lifestyle modifications.
- Trained how to work with healthcare providers and work as a part of an
  integrated healthcare team.

For more on the EIM Credential program, please visit the following website:
http://certification.acsm.org/exercise-is-medicine-credential
Identifying Local Community Programs
Another helpful step in developing a referral network is finding trusted local programs and facilities to which you can refer your patients. Our communities often offer a wealth of untapped programs that go largely unknown to the general public. To identify these available programs, begin by contacting health club or fitness facilities in your community, YMCAs, and the local community centers. Furthermore, many of these facilities will also have in-house fitness professionals that qualify for your network. By including qualified programs in your community, you will be ensuring that your patients have convenient access to the support and guidance that they need.

Developing an Exercise Referral Network
As you begin identifying local professionals, programs, and facilities, it will be helpful to formally develop a referral network to have this information readily available for your patients when they are in the clinic. We understand that you are likely too busy to develop an extensive referral network yourself. However, most offices have interns and volunteers (i.e., local students) who might be able to take on this project for your office.

Additionally, to help healthcare providers develop and grow their referral network, EIM is developing a national database of credentialed exercise professionals and qualified physical activity programs. This database will include professionals and facilities that are familiar with the EIM model and have been trained to accept referrals from healthcare providers. These professionals and facilities will have a special recognition to show they are familiar with and have completed EIM training modules, and have met EIM standards of practice.

a - It is highly recommended that you refer your patients only to fitness professionals who have been certified through an NCCA-accredited association (click on “Accredited Certification Programs” at www.noca.org) such as the American Council on Exercise (ACE), the American College of Sports Medicine (ACSM), the Cooper Clinic, the National Academy of Sports Medicine (NASM), the National Strength and Conditioning Association (NSCA), or one of the seven other accredited fitness associations (Academy of Applied Personal Training Education, International Fitness Professionals Association, National Athletic Trainer’s Association Board of Certification, National Council on Strength and Fitness, National Exercise and Sports Trainers Association, National Exercise Trainers Association, National Federation of Professional Trainers).
Being a Champion in Your Health System

As a supporter of Exercise is Medicine®, we need your assistance in promoting the benefits of physical activity in your healthcare system and community. In becoming an EIM Champion, you will be faced with the task of navigating through a rapidly changing environment. While this may seem imposing, the rapid changes in our health system also bring with them great opportunity. In the future, healthcare leaders, such as yourself, will be on the forefront of identifying new opportunities for the adoption and integration of the EIM “Solution” within new healthcare models and systems. The EIM Solution is a system that supports the patients, providers, and payers through a Population Health Management care model that will assist healthcare providers in assessing and prescribing physical activity, stratifying eligible patients, employees, and underserved community residents into risk categories and connecting them with local physical activity resources.

The first step that you can take in being an EIM Champion is to gain the support of colleagues and healthcare professionals at your institution. Educating them on the benefits of prescribing physical activity for their patients is an essential first step that you can take. This can be done through seminars or work lunches, for which we can provide you with EIM slide presentations. The next step is to approach and gain the support of your healthcare administrative team. Again, we are happy to support your efforts through joint conference calls or directly communicating with your leadership.

Once you have gained the support of your colleagues and administration, one of the next steps includes integrating the Physical Activity Vital Sign (see the “Assessing Physical Activity” section of this guide) in your healthcare system’s electronic medical records. Other steps, such as developing a physical activity order set, which will lead to your patients receiving a customized physical activity prescription, and stratifying them into at-risk population groups for tailored guidance, will further “hard-wire” the EIM Solution into the workflow of your healthcare system. These are examples of just some of the initial steps that can be taken in making physical activity a standard part of your disease prevention and treatment paradigm!

At the end of the day, implementing the EIM Solution in your healthcare system is not a one-person job. The EIM team is willing and available to support and advance your efforts. We encourage you to utilize our online resources, such as this guide and our EIM presentation slides, which will allow you to effectively gain support and educate others in your effort to be an EIM Champion in your healthcare system. Most importantly, we encourage you and the administrators in your healthcare system to contact us for further information and assistance in adapting the EIM Solution for your needs!

APPENDIX B - Physical Activity Vital Sign (PAVS)

1. On average, how many days per week do you engage in moderate to strenuous exercise (like a brisk walk)?
   
   ______ days

2. On average, how many minutes do you engage in exercise at this level?
   
   ______ minutes
Appendix C - Physical Activity Readiness Questionnaire (PAR-Q)

PATIENT’S NAME: ____________________________________ DOB: ______________

DATE: ______________

HEALTHCARE PROVIDER’S NAME: __________________________

Please read the questions below carefully, and answer each one honestly. Please check YES or NO.

☐ Yes ☐ No Has your healthcare provider ever said that you have a heart condition and that you should only do physical activity recommended by a healthcare provider?

☐ Yes ☐ No Do you feel pain in your chest when you do physical activity?

☐ Yes ☐ No In the past month, have you had chest pain when you were not doing physical activity?

☐ Yes ☐ No Do you lose your balance because of dizziness or do you ever lose consciousness?

☐ Yes ☐ No Do you have a bone or joint problem (for example, back, knee or hip) that could be made worse by a change in your physical activity?

Excerpted from the Physical Activity Readiness Questionnaire (PAR-Q) © 2002. Used with permission from the Canadian Society for Exercise Physiology.
Appendix D - ACSM Risk Stratification
Screening Questionnaire

Assess your health by marking all true statements.

You have had:

___ a heart attack
___ heart failure
___ cardiac arrhythmia
___ known heart murmur
___ congenital heart disease
___ any heart surgery
___ coronary angioplasty
___ heart palpitations

You have:

___ experienced chest pain with mild exertion
___ experienced dizziness, fainting, or blackouts with mild exertion
___ experienced unusual fatigue or shortness of breath during usual activities
___ been prescribed heart medications (please indicate):

Check all that apply:

___ you are a man older than 45 years
___ you smoke
___ your blood pressure is greater than 140/90
___ you take blood pressure medication
___ you are completely physically inactive
___ you currently have bone/joint problems
___ you have had a recent injury/surgery
___ you are a diabetic or take medicine to control your blood sugar
___ you have been diagnosed with high cholesterol >200 (or HDL is less than 35 mg/dL
   or LDL is greater than 169 mg/dL)
___ you have a close blood relative who had a heart attack before age 55
   (father/brother) or age 65 (mother/sister)
___ Other (specify) ______________________________________________

Use the following risk stratification scoring table (page 17) to sum the total number of
risk factors present in your patient in determining their current level of cardiovascular
disease risk.
## Risk Stratification Scoring

* See Appendix E for Risk Categories and related recommendations for Screening, Clinical Testing, and Exercise Recommendations.
Appendix E - ACSM Risk Stratification Screening Classification

ACSM Risk Stratification

Low Risk
Asymptomatic
≤ 1 Risk Factor
- Medical Exam and GXT Before Exercise?
  - Moderate Ex = Not necessary
  - Vigorous Ex = Not necessary
- Doctor Supervision of Exercise Test?
  - Submaximal = Not necessary
  - Maximal = Not necessary

Moderate Risk
Asymptomatic
≥ 2 Risk Factors
- Medical Exam and GXT Before Exercise?
  - Moderate Ex = Not necessary
  - Vigorous Ex = GXT not necessary, Medical Exam only
- Doctor Supervision of Exercise Test?
  - Submaximal = Not necessary
  - Maximal = Recommended

High Risk
Symptomatic or known cardiac pulmonary or metabolic disease
- Medical Exam and GXT Before Exercise?
  - Moderate Ex = Recommended
  - Vigorous Ex = Recommended
- Doctor Supervision of Exercise Test?
  - Submaximal = Recommended
  - Maximal = Recommended

GXT = Graded Exercise Test
Appendix F - Exercise Stages of Change Questionnaire

Goal: To do physical activity or exercise regularly, such as accumulating:

- 150 minutes of moderate physical activity per week, or
- 75 minutes of vigorous physical activity per week, or
- a combination of moderate and vigorous physical activity each week, such as
  - 75 minutes of moderate and 40 minutes of vigorous physical activity, or
  - 90 minutes of moderate and 25 minutes of vigorous physical activity

Examples of Moderate-Intensity Activity

- Brisk walking
- Biking<10 mph (16kph)
- Ballroom dancing
- General gardening, such as weeding
- Golfing (no cart)
- Any other physical activity where the exertion is similar to these

Examples of Vigorous-Intensity Activity

- Jogging, running
- Tennis
- Biking>10 mph (16kph)
- Aerobic dancing
- Heavy gardening, such as digging
- Any other physical activity where the exertion is similar to these

Regular physical activity means meeting or exceeding the physical activity goal described above.

For each statement, please mark yes or no.

1. I am currently physically active (at least 30 minutes per week).  
   - Yes  
   - No

2. I intend to become more physically active in the next 6 months.  
   - Yes  
   - No

3. I currently engage in regular physical activity.  
   - Yes  
   - No

4. I have been regularly physically active for the past 6 months.  
   - Yes  
   - No

Exercise Stages of Change - Scoring Key

- **No** to 1, 2, 3, and 4 = Pre-contemplation stage
- **No** to 1, 3, and 4, **Yes** to 2 = Contemplation stage
- **Yes** to 1 and 2, **No** to 3 and 4 = Preparation stage
- **Yes** to 1 and 3, **Yes or No** to 2, **No** to 4 = Action stage
- **Yes** to 1, 3, and 4, **Yes or No** to 2 = Maintenance stage

"PHYSICAL ACTIVITY GUIDELINES
Adults aged 18-64 with no chronic conditions: Minimum of 150 minutes of moderate physical activity a week (for example, 30 minutes per day, five days a week) and muscle-strengthening activities on two or more days a week (2008 Physical Activity Guidelines for Americans).
For more information, visit www.acsm.org/physicalactivity."
Appendix H – Disease-Specific Physical Activity Prescriptions

The following are 3 examples (of more than 40) of disease-specific exercise prescriptions freely available on the Exercise is Medicine® website.
Getting Started

- Talk with your health care provider before starting an exercise program and ask for specific programming recommendations.
- Take all medications as recommended by your physician.
- The goals of your program should be to maintain and, if possible, improve your current level of joint flexibility, muscular strength and endurance, and cardiovascular endurance.
- Choose low-impact activities such as swimming and recumbent cycling. Walking is a good choice if you are not experiencing problems with your gait or balance. Yoga and tai chi also provide additional minority benefits.
- Start slowly and gradually progress the intensity and duration of your workouts. Aim to exercise aerobically at least 30 minutes, three times per week and strength train on alternate days twice per week. Stretching exercises to improve your range of motion should precede before every workout.
- Be prepared to adjust your workouts according to the progression or regression of your symptoms. Monitor your response to exercise; if you feel fatigued rather than energized you may be overdoing it.

Exercise Cautions

- Avoid exercising in high temperatures and during the hottest part of the day (typically from 10:00 a.m. to 2:00 p.m.). Drink cool fluids before, during and after your exercise session.
- Avoid high-impact activities such as running and situations that may increase your risk of falling.
- Avoid exercise to the point of pain if something hurts, don’t do it.

Your exercise program should be designed to maximize the benefits with the safest risk of aggravating your health or physical condition. Consider contacting a certified health and fitness professional who can work with you and your health care provider to establish realistic goals and design a safe and effective program that addresses your specific needs.

"If your health care provider has not cleared you for independent physical activity and would like you to be monitored in a hospital setting or a medical fitness facility, you should exercise under the supervision of a certified professional. The American College of Sports Medicine (ACSM) has two groups of certified fitness professionals that can meet your needs. The ACSM Certified Clinical Exercise Specialist (CES) is certified to support those with heart disease, diabetes and lung diseases. The ACSM Certified Personal Trainer (CPT) is qualified to support patients with a wide range of health challenges. You may locate an ACSM-certified fitness professional by using the finder at www.acsm.org."

Your Prescription for Health Series
EXERCISING WITH PARKINSON’S DISEASE

Getting Started

A safe and effective exercise program can reduce the symptoms of Parkinson’s disease by increasing muscle strength and endurance, enhancing mobility and reducing your risk of falling. Regular physical activity can also help improve your balance and coordination, and enhance your overall quality of life. The key is to determine what type of exercise is best for you, and to follow a program that accommodates your individual needs and concerns.

Exercise Cautions

- If fatigue is an issue, try exercising in the morning.
- If you are at risk of falling or freezing (becoming rigid), hold on to a chair when performing standing exercises or chair-based exercises, and avoid excessive, sudden, and large movements that could cause falls.
- Avoid excessive, sudden, and large movements that could cause falls.
- Your exercise program should be designed to maximize the benefits with the fewest risks of aggravating your health or physical condition. Consult a certified health and fitness professional who can work with you and your health care provider to establish realistic goals and design a safe and effective program that addresses your specific needs.
